

Architecture and Settlements

Duskaran cities are masterpieces of practicality and art, designed to withstand the planet's relentless winds while fostering communal life. Terraced wind-cities are engineered to channel airflow safely, with towering outer walls serving as both defenses and windbreaks. These walls are adorned with protective carvings, blending functionality with spirituality. Within, inner courtyards act as communal hubs for gatherings, resource storage, and rituals.

Settlements are carefully arranged using principles reminiscent of feng-shui, aligning with wind channels for optimal airflow and comfort. Wind towers, central to many cities, not only cool their surroundings but also serve as spiritual symbols of harmony with the planet's forces. Family compounds, known as Wind-Kins, house multigenerational groups in tightly-knit units. These compounds often extend underground, where geothermal insulation offers stability and warmth, emphasizing the importance of shared resources.

Vertical farming towers rise throughout the settlements, combining ancient terracing techniques with modern hydroponics. These communal efforts, adorned with motifs of fertility and balance, maximize agricultural yield in limited spaces. Sacred spaces, positioned at wind-focal points, provide tranquil sites for meditation, rituals, and weatherworking ceremonies, weaving spirituality into the fabric of daily life.
